

## CLAIMS

1. (amended) A motor drive apparatus comprising:  
estimation means (89, 91) estimating an amount of demagnetization of a  
5 permanent magnet motor (60) based on a voltage control amount of the q axis applied in  
a case where said permanent magnet motor (60) is controlled using a d-q axis  
transformation; and  
operation handling means (91) limiting an output of said permanent magnet  
motor (60) when said estimated amount of demagnetization is larger than a  
10 predetermined value.
2. The motor drive apparatus according to claim 1, further comprising a  
converter (20) changing an input voltage necessary for driving said permanent magnet  
motor (6), wherein  
15 said estimation means (89, 91) corrects said estimated amount of  
demagnetization according to the level of said input voltage.
3. The motor drive apparatus according to claim 1, wherein  
said estimation means (89, 91) estimates said amount of demagnetization by  
20 comparing the voltage control amount of the q axis to be controlled with a reference  
value.
4. The motor drive apparatus according to claim 3, wherein  
said estimation means (89, 91) holds, in the form of a map (MAP), the reference  
25 values correlated with at least two revolution numbers to extract said reference value  
from said map (MAP) and estimate said amount of demagnetization.
5. The motor drive apparatus according to claim 1, wherein
